entrepreneurs**

**with**  **NANDO**

**Interbank** is one of the main financial institutions in Peru and its purpose is to accompany Peruvians to fulfill their dreams, today. Interbank is focused on providing service experiences in its digital channels and financial agencies throughout the country

Within the framework of the First ASEP Entrepreneurs Summit in Lima, organized by the Entrepreneurs Association of Peru and PromPeru, with the support of BID, and many Government Ministries (Ministries of Work, Tourism, External Commerce, Culture), Interbank introduced Nando, a tool that helps entrepreneurs manage their business. This product is currently being developed by Globant.

Nando, developed by Interbank, in collaboration with La Victoria Lab, is a mobile platform that helps entrepreneurs manage their business and focus on the numbers that matter. The team identified that entrepreneurs struggled to stay in control of their business while pushing for growth at the same time. In that context, entrepreneurs need someone they can trust to manage the numbers, so they can focus on growing their business.

Nando allows entrepreneurs manage their sales orders in a calendar view and have visibility of their deliveries and pending payments. In addition, Nando helps entrepreneurs with reminders of these orders so they never lose track of an order or delivery. Finally, by adding expenses with receipt photos, entrepreneurs will have a general understanding of their business performance.

One of the critical aspects when creating the product was ensuring availability, reliability and security. Memcached is used as object cache, and Datastore is the repository of information. All the APIs have been built with App Engine. For the software development they used Firebase and SendGrid.

Juan Pablo Florez, Product Owner from Interbank, said: "Globant's proposal of using Google Cloud Platform allowed us to quickly leverage infrastructure, service, storage and deployment, making more room for us to focus on building the value proposition and have a mobile application ready to market and test with real users in 5 weeks".

With this approach, data is secured in the cloud, no matter which device is being used, then information will never be lost, and business will be accessible from the phone, whenever the owner is.

Google Cloud Platform, offered by Google, is a suite of cloud computing services that runs on the same infrastructure that Google uses internally for its end-user products, such as Google Search and YouTube. Alongside a set of management tools, it provides a series of modular cloud services including computing, data storage, data analytics and machine learning.
